384-SLICE MSCT ANGIOGRAPHY OF LEFT UPPER LIMB:-

MSCT angiogram was performed after injecting non-ionic contrast through antecubital vein. These images were reviewed with MIP, SSD and Volume Rendering. Complex image reconstruction post processing was likewise performed as indicated to increase the sensitivity of detecting clinically relevant pathology.

Visualized ascending and descending thoracic aorta: appears normal in course and calibre. No evidence of stenosis or thrombus within it.

Arch of aorta: Left arch, normal branching.

Atheromaotous fibro-fatty plaques with subtle luminal irregularities & irregular surface noted in distal arch.

No e/o floating thrombus or significant luminal occlusion.

- No e/o bilateral bony cervical ribs.
- No abnormal scalene muscles insertion noted on either side.

ARTERY	RIGHT SIDE	LEFT SIDE
Subclavian artery	Patent.	Patent.
Axillary artery	Patent.	Patent.
Brachial artery	Patent.	Patent except for acute total thrombotic occlusion of distal most brachial artery at elbow.
Ulnar artery	Not evaluated.	Near total thrombus at origin, rest patent.
Radial artery	Not evaluated.	Near total thrombus at origin, rest patent. Short segment severe thrombotic narrowing in distal segment.
Interosseous artery	Not evaluated.	Patent.
Digital arteries	Not evaluated.	Faintly visualized.

- Visualized veins appear normal.
- Visualized both lung fields: Normal.

IMPRESSION:

- Atheromaotous fibro-fatty plaques with subtle luminal irregularities & irregular surface in distal arch. No e/o floating thrombus or significant luminal occlusion.
- Acute total thrombotic occlusion of distal most left brachial artery at elbow → extending to origins of left ulnar and radial arteries.
- No e/o bony cervical ribs on either side.

DOPPLER UPPER LIMB ARTERIAL BOTH

FINDINGS :

TECHNIQUES: All the arteries were studied with B-mode, colour doppler and correlated with pulsed doppler study.

FINDINGS:

LEFT UPPER LIMB:

Brachial artery in cubital fossa shows thickened walls and partially filling up of lumen with reduced PSV ~ 31 cm/s. Radial artery in proximal and mid part shows diffusely thickened walls with no colour uptake.

Distal part of radial artery shows reduced PSV with absent diastolic flow.

Possibility of stenosis at the level of proximal radial artery needs to be ruled out.

Biphasic waveform in ulnar artery with mildly reduced PSV.

RIGHT UPPER LIMB:

Right Brachial, radial and ulnar arteries show normal luminal morphology. No evidence of thickening, calcification or plaque seen.

On color doppler study, there is normal flow in above mentioned vessels and spectral doppler shows normal peak systolic velocity.
